

From all land grid cells within the big box:

AND

$lcf_{tr}, lcf_{sh}, lcf_{cg}, snc, \alpha$   
at monthly resolution for 2000-2004

$lcc_{tr \rightarrow cg}$   
between pre-industrial and 1981-2000  
(and long, lat, elev)

if at least 15 grid cells in the big box including  $i$  are snow-free ( $snc < 0.1$ ) and  $lcf_{tr} + lcf_{sh} + lcf_{cg} > 90\%$

Equations (1), (3), (4)

Reconstructed albedo of trees and crops/grasses in  $i$  under snow-free conditions  
 $\alpha_{tr}^{sf}(i), \alpha_{cg}^{sf}(i)$

if at least 15 grid cells in the big box including  $i$  are snow-covered ( $snc > 0.9$ ) and  $lcf_{tr} + lcf_{sh} + lcf_{cg} > 90\%$

OR

Equations (2), (5), (6)

Reconstructed albedo of trees and crops/grasses in  $i$  under snow-covered conditions  
 $\alpha_{tr}^{sc}(i), \alpha_{cg}^{sc}(i)$

if at least 15 land grid cells:

Equations (7), (8)

Reconstructed historical albedo change associated with conversions between trees and crops/grasses in  $i$
