Table S1: This table summarises the parameters perturbed in the HadGEM3-GC3.05 PPE used in this study. 47 independent and 5 dependent model parameters were perturbed across the physical atmosphere, aerosol and land surface schemes. The model schemes are shown in light grey at the beginning of each section. The name and a brief description of each perturbed parameter are shown. The process for parameter selection and more detail on the distribution and effect of each parameter is found in Sexton et al. 2021.

Perturbed parameter	Name	Description	
Convection			
ent_fac_dp	Deep entrainment amplitude	Controls the shape of the mass flux and sensitivity of deep convection to relative humidity to deep entrainment.	
ent_fac_md	Mid entrainment amplitude	Controls the shape of the mass flux and the sensitivity of mid-level convection to relative humidity to mid-level entrainment.	
amdet_fac	Mixing detrainment	Controls the rate of humidification of the atmosphere and the shape of the convective heating profile.	
r_det	Coefficient for adaptive detrainment	Decrease of mass flux with height under decreasing parcel buoyancy.	
cca_md_knob, cca_dp_knob	Convective core radiative effects	Controls how much deep and mid-level convective core gets seen by radiation.	
cca_sh_knob	Shallow convection core radiative effects	Controls how much shallow convection gets seen by radiation.	
mparwtr	Maximum condensate	The maximum condensate a convective parcel can hold before it is converted to precipitation.	
qlmin	Minimum critical cloud condensate	The minimum value of the function that defines the maximum amount of condensate a convective parcel can hold before it is converted to precipitation.	
Gravity wave drag		-	
gwd_frc	Critical Froude number	Determines the cut-off mountain height and the depth of the blocked flow layer around sub-grid mountains.	
fbcd	Flow blocking drag coefficient	Determines the size of the low-level drag associated with flow blocking effects by subgrid mountains.	
gwd_fsat	Inverse critical Froude number for wave saturation	Determines the amplitude at which mountain waves generated by sub-grid orography will break, and exert a drag on the flow.	
gsharp	Mountain wave amplitude	Determines the amplitude of the mountain waves generated by sub-grid orography.	
orog_drag_param	Drag coefficient for turbulent form drag	Determines the size of the form drag exerted on flow by small-scale sub-grid hills.	
nsigma	Scaling factor applied to the standard deviation of sub-grid mountain heights.	Determines the local assumed sub-grid orography height which is used in the gravity wave drag scheme.	
Boundary layer			
g0	Flux profile parameter	Used in the definition of stability functions.	
ricrit = 10.0 / g0	Critical Richardson number	Value of Richardson number below which air becomes dynamically unstable and turbulent.	
a_ent_1	Cloud-top entrainment rate.	Used in entrainment rate calculation.	
g1	Cloud-top diffusion	Used in cloud-top diffusion calculation.	

zhloc_depth_fac	Threshold fraction of the cloud layer depth	Fractional height into cloud layer for which Ribased boundary layer depth can diagnose shear dominated layer.	
par_mexcla	Neutral mixing length	Mixing length for fluid parcels under neutral stability conditions.	
lambda_min	Minimum value of		
_	mixing length.		
dec_thresh_cld,	Decoupling threshold for		
dec_thresh_cloud2cu	cloud boundary layers		
forced_cub_fac	Mixing factor applied to	Determines the fraction of diagnosed adiabatic	
	the in-cloud water	water content of forced cumulus clouds which is	
	content of forced	allowed to remain.	
	cumulus clouds		
Clouds and cloud radiatio			
dbsdtbs_turb_0	Cloud erosion rate	Determines the rate which un-resolved sub-grid motions mix clear and cloudy air.	
two_d_fsd_factor	Scaling to make sub-grid	Makes the cloud water variability around the	
	cloud condensate	grid box average a two dimensional relationship,	
	variance to cloud cover	based on 1-d empirical relationship.	
	and convective activity		
	to dimensional		
dp_corr_strat	Decorrelation scale	Determines the vertical overlap between clouds	
	pressure	in the sub-column in the cloud generator used to calculate the radiative impact of clouds.	
ice_width	Ice width	Determines the amount of ice water content that	
		corresponds to a factor of two reduction in the	
		width of the vapour distribution in the liquidfree	
G1 1 1 1 1		part of the grid box.	
Cloud microphysics			
c_r_correl	Cloud-rain correlation	Determines the sub-grid correlation between	
	coefficient	cloud and precipitation.	
m_ci	Ice fall speed	Scaling factor for the ice fall speed.	
ai	Precursor coefficient in	Changing ai has the effect of changing the	
	the mass-diameter	density of ice.	
1 <sub></sub>	relationship for ice	Controls the shape of the neuticle size	
x1r		Controls the shape of the particle size distribution for raindrops.	
ar	Aspect ratio of ice	Used to calculate the depositional capacitance of	
ai	particles	ice crystals which affects how efficiently they	
	particles	grow by depleting water vapour.	
mp_dz_scal	Vertical scale in	Vertical length scale over which the turbulence	
p_az_50a1	mixedphase turbulent	acts to produce supercooled water.	
	production of	Francis and American	
	supercooled liquid water		
Aerosols	1 1	ı	
ps_anth_so2_emiss	Anthropogenic SO <sub>2</sub>	Direct scaling of anthropogenic SO <sub>2</sub> emission	
	emission flux	flux.	
ps_dry_so2_veloc	Dry deposition rate of	Scaling factor for the dry deposition rate which	
	$SO_2$	removes SO <sub>2</sub> from lowest levels through	
		deposition according to land surface type and	
		prevailing wind speed.	

r		1	
ps_sigma_updraught	Scaling of the standard	Relates the activation of aerosols to cloud	
	deviation use to define the pdf of updraught	droplets to the standard deviation used to define	
	velocity	the pdf of updraught velocity.	
hiom oar ome coaling	Scaling of emission flux	Direct scaling of emission flux	
biom_aer_ems_scaling	_	Direct scaling of emission flux.	
	from biomass burning		
ps_natl_ss_emiss	Scaling of emission flux	Direct scaling of emissions flux.	
	from sea spray		
ps_natl_dms_emiss	Dimethyl-sulphide emission flux	Direct scaling of emissions flux.	
ns acc cor scay	Scavenging rate in the	Scaling of the scavenging rate calculated in the	
ps_acc_cor_scav	coarse and accumulation	model.	
	modes.	model.	
ps_cloud-pH	pH of cloud drops	Controls the in-cloud SO <sub>4</sub> production dependent	
ps_cloud-pff	pri or cloud drops	on SO <sub>2</sub> availability.	
Land surface and snow		on soz uvanaomej.	
Zana sarrace and snow			
u10_max_coare	Maximum wind speed	This is the highest wind speed used in calculating	
	used in the Coupled	the Charnock coefficient in the COARE	
	Ocean-Atmosphere	algorithm.	
	Response Experiment		
	(COARE) algorithm		
r0	Grain size of fresh snow	The grain size of fresh snow is set to this value.	
rho_snow_fresh	Fresh snow density	The density of fresh snow.	
tupp_io	Upper value about 4K	Temperatures above the optimal value for	
	above the optimal value	photosynthesis will drive a decline in	
	for photosynthesis	photosynthesis.	
f0_io	Maximum ratio of	Controls the gradient of CO <sub>2</sub> between plant	
	internal to external CO <sub>2</sub>	stomata and the ambient air.	
dz0v_dh_io	Rate of change of	Controls surface roughness which affects the	
	vegetation roughness	surface exchange of momentum and therefore	
	length for momentum	heat, water and trace gases.	
	with height		
nl0-io	Top leaf nitrogen	Defines the top leaf ration of nitrogen to carbon.	
	concentration	Plant photosynthesis is defined in the model to	
		be proportional to the leaf nitrogen	
		concentration.	
rootd_ft_io	Root depth	Controls the depth to which soil moisture is	
		available.	
psm	Scaling factor for critical	This pair of parameters control the critical and	
	and saturation levels for	saturated volumetric soil moisture thresholds.	
	soil moisture towards	The critical threshold controls the level above	
	wilt level	which evapotranspiration is no longer soil	
		moisture dependent.	

Figure S1: 1860 to 1975 aerosol ERF for individual ensemble members. Global mean aerosol ERF, and northern hemisphere (0 to 60  $^{\circ}$ N) – southern hemisphere (0 to 60  $^{\circ}$ S) are shown above each ensemble member. The ensemble mean and standard deviation are shown in the first two plots.

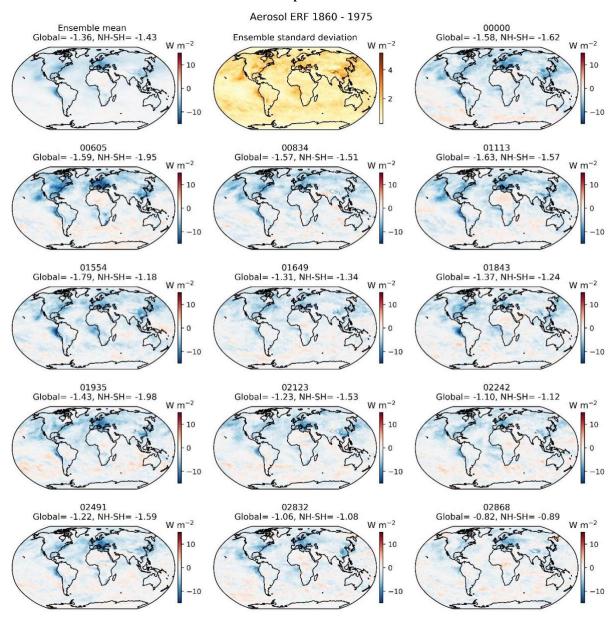

Figure S2: 1860 to 2005 aerosol ERF for individual ensemble members. Global mean aerosol ERF, and northern hemisphere (0 to 60  $^{\circ}$ N) – southern hemisphere (0 to 60  $^{\circ}$ S) are shown above each ensemble member. The ensemble mean and standard deviation are shown in the first two plots.

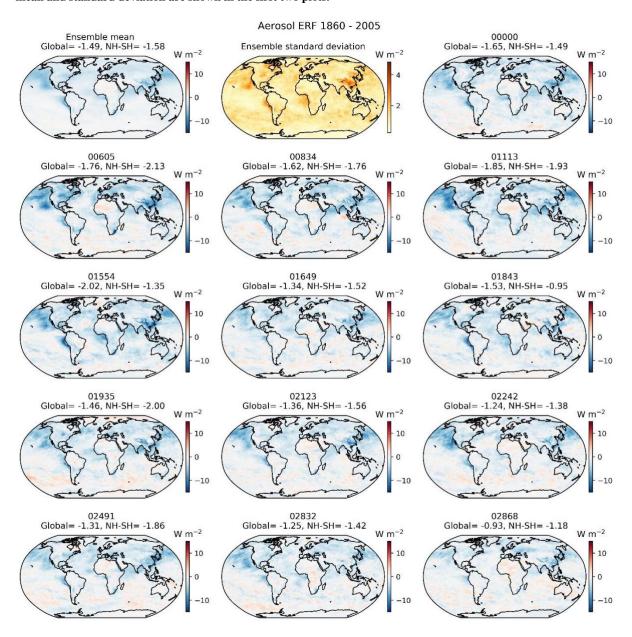

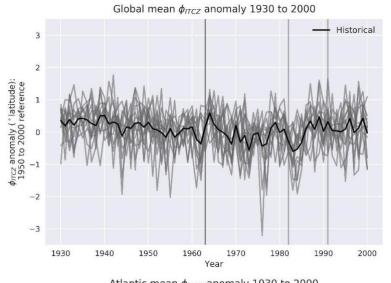

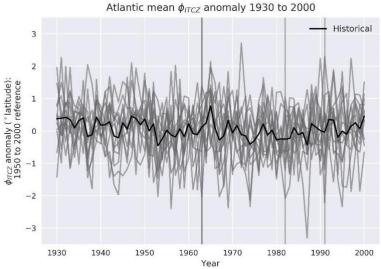

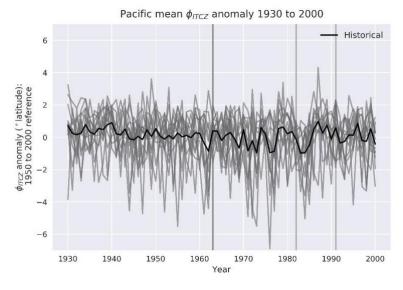

Figure S3: Time series of  $\Phi_{TTCZ}$  anomaly against a 1950 to 2000 reference period with no rolling mean for global (top, 0 - 360  $^{\circ}$  longitude), Atlantic (middle, -70 - 10  $^{\circ}$  longitude) and Pacific regional means (150 - 285  $^{\circ}$  longitude). Major volcanic eruptions are marked with grey vertical lines. The ensemble mean is shown by the darker line, and the individual ensemble members in the lighter lines.

**Text S1.** Tropical precipitation shifts were also calculated based on the methodology in Allen et al. 2015 in order to compare the spread in our single-model PPE to a multi-model ensemble. First, the annual precipitation anomaly is calculated against a 1961 – 1990 base period. This methodology then defines tropical precipitation shifts (mm decade<sup>-1</sup>) as the difference between area-weighted northern hemisphere  $(0-20~{}^{\circ}\text{N})$  and southern hemispheric  $(0-20~{}^{\circ}\text{N})$  regional means over land and ocean. The Atlantic region is defined  $(75~{}^{\circ}\text{W}-30~{}^{\circ}\text{E})$  and the Pacific region as  $(30~{}^{\circ}\text{E}-75~{}^{\circ}\text{W})$ . The trend over 1950-1985 is calculated from the 5-year rolling mean of this metric.

Figure S4. The 1950 to 1985 trend in the tropical precipitation metric (NH-SH PRECT / mm decade $^{-1}$ ) defined in Text S1 over land and ocean for the three regional means.

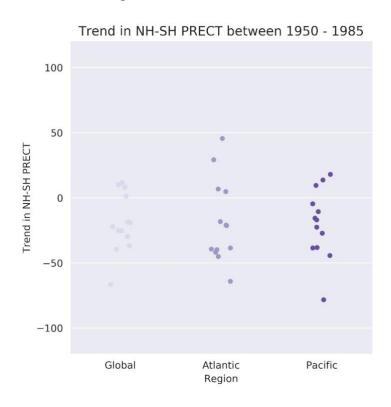

Figure S5: Scatter plot of trend in 5-year rolling mean  $\Phi_{TTCZ}$  in 1950 to 1985 (top) against ocean-only interhemispheric (60 °S to 60 °N) trend in surface air temperature (top), total implied radiative forcing (middle) and 1860 to 1975 aerosol ERF (bottom) for global (left), Atlantic (middle) and Pacific (right) regional means. Individual ensemble members are coloured according to legend. Spearman's rank correlation coefficient is shown at top left of each plot.

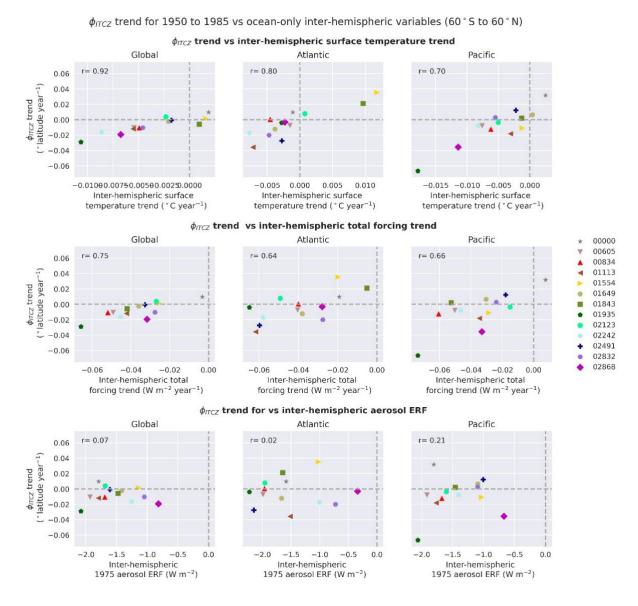

Table S2. Table of Spearman's rank correlation coefficients for the trend in global mean 5-year rolling mean  $\Phi_{TTCZ}$  and ocean-only inter-hemispheric variables shown in Figure 3 for the time periods: 1950 to 1985, 1950 to 1980, 1940 to 1985, 1940 to 1980 and 1940 to 1975.

Time period	Correlation with the trend in interhemispheric surface air temperature (°C year-1)	Correlation with the trend in interhemispheric implied total forcing (W m <sup>-2</sup> year <sup>-1</sup> )	Inter-hemispheric 1860 to 1975 aerosol ERF (W m <sup>-2</sup> )
1950 to 1985 (shown)	r= 0.92	r= 0.75	r= 0.07
1950 to 1980	r= 0.69	r= 0.66	r= 0.14
1940 to 1985	r= 0.19	r= 0.55	r= -0.08
1940 to 1980	r= -0.03	r= 0.49	r= -0.10
1940 to 1975	r= 0.26	r= 0.63	r= -0.35

Figure S6: Time series of the inter-hemispheric (60  $^{\circ}$ S to 60  $^{\circ}$ N, NH-SH) surface temperature anomaly against a 1950 to 2000 reference period with a 5-year rolling mean for global (top, 0 - 360  $^{\circ}$  longitude), Atlantic (middle, -70 - 10  $^{\circ}$  longitude) and Pacific regional means (150 - 285  $^{\circ}$  longitude). Historical emissions are shown in black, RCP8.5 in red and RCP2.6 in blue. Major volcanic eruptions are marked with grey vertical lines. The ensemble mean is shown by the darker line, and the individual ensemble members in the lighter lines.

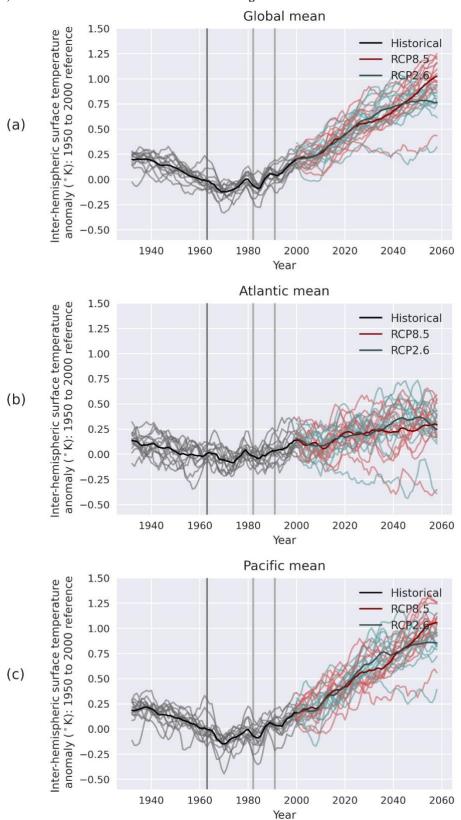

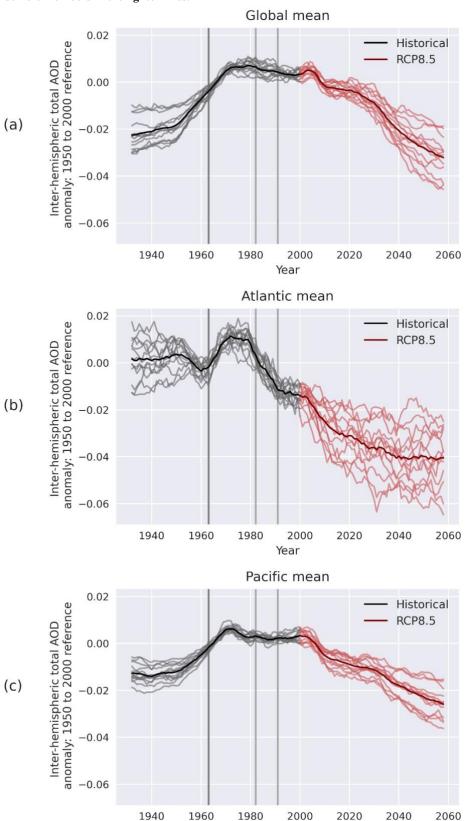

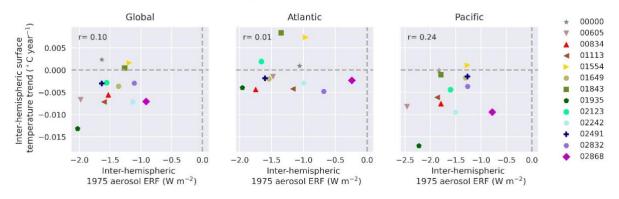

Figure S7: Time series of the inter-hemispheric (60  $^{\circ}$ S to 60  $^{\circ}$ N, NH-SH) total AOD anomaly against a 1950 to 2000 reference period with a 5-year rolling mean for global (top, 0 - 360  $^{\circ}$  longitude), Atlantic (middle, -70 - 10  $^{\circ}$  longitude) and Pacific regional means (150 - 285  $^{\circ}$  longitude). Historical emissions are shown in black and RCP8.5 in red. Major volcanic eruptions are marked with grey vertical lines. The ensemble mean is shown by the darker line, and the individual ensemble members in the lighter lines.

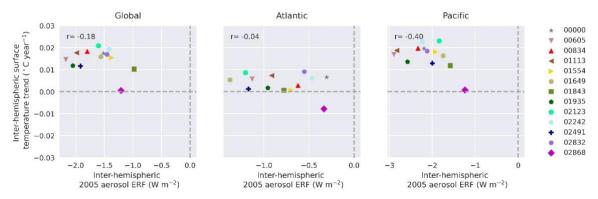

Year

Figure S8: Scatter plot of (top) 1950 to 1985 inter-hemispheric surface temperature trend against 1860 to 1975 aerosol ERF and (middle, bottom) 2006 to 2060 inter-hemispheric surface temperature trend against 1860 to 2005 aerosol ERF for global (left), Atlantic (middle) and Pacific (right) regional means. Individual ensemble members are coloured according to legend. Spearman's correlation coefficient is shown at top left of each plot.

Inter-hemispheric (60  $^{\circ}$  S to 60  $^{\circ}$  N) 2006 to 2060 RCP8.5 surface temperature trends vs 1860 to 2005 aerosol ERF

Inter-hemispheric (60  $^{\circ}$  S to 60  $^{\circ}$  N) 2006 to 2060 RCP2.6 surface temperature trends vs 1860 to 2005 aerosol ERF

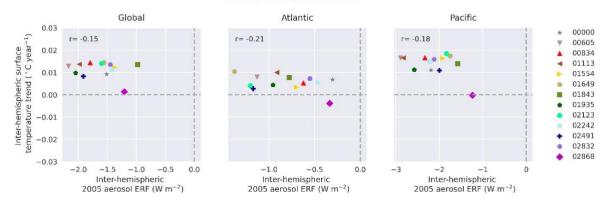

Figure S9: Scatter plot of the 1950 to 1985 trend in 5-year rolling mean  $\Phi_{TTCZ}$  against inter-hemispheric top of atmosphere outgoing shortwave flux (rsut) (0 to 60 °S and °N latitude) for global (left), Atlantic (middle) and Pacific (right) regional means. Individual ensemble members are coloured according to legend. Spearman's rank correlation coefficient is shown at top left of each plot.

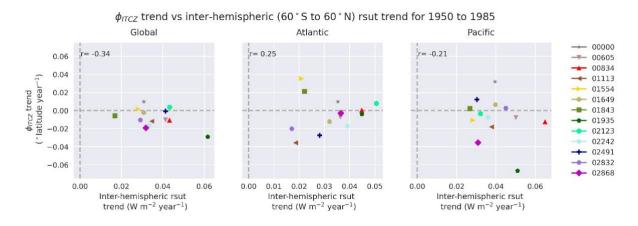

Figure S10: Scatter plot of the 1950 to 1985 trend in 5-year rolling mean  $\Phi_{ITCZ}$  against inter-hemispheric (0 to 60 ° S and ° N latitude) total AOD (top) and dust AOD (bottom) for global (left), Atlantic (middle) and Pacific (right) regional means. Individual ensemble members are coloured according to legend. Spearman's rank correlation coefficient is shown at top left of each plot.

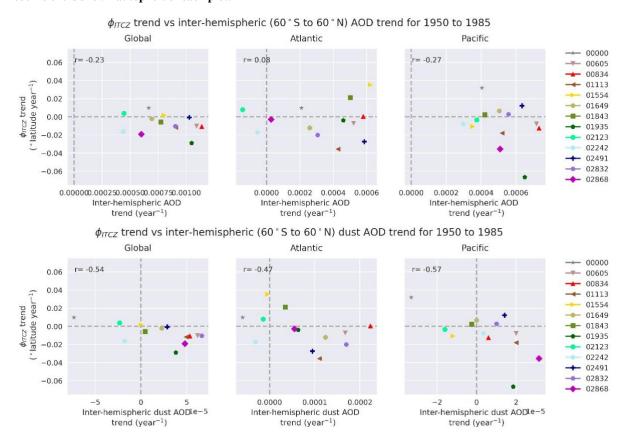

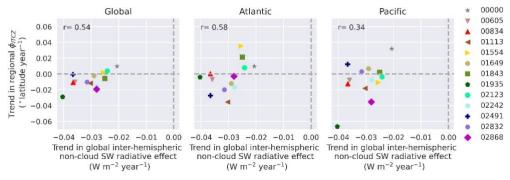

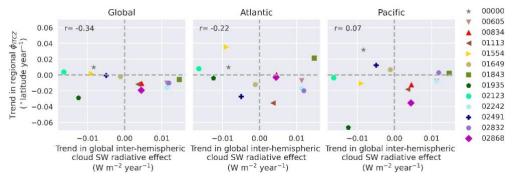

Figure S11: Scatter plot of 1950 to 1985 and 1940 to 1975 trend in 5-year rolling mean  $\Phi_{\rm ITCZ}$  against trend in global inter-hemispheric (90 °S to 90 °N) implied forcing from shortwave non-cloud interactions and cloud interactions for global (left), Atlantic (middle) and Pacific (right) regional. Spearman's rank correlation coefficient is shown at top left of each plot.

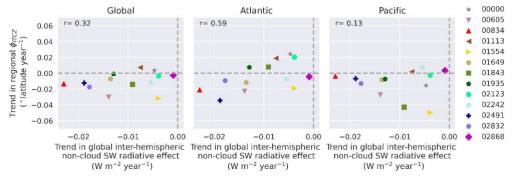

Trend in regional  $\phi_{ITCZ}$  vs inter-hemispheric (90 ° S to 90 ° N) shortwave non-cloud radiative effect between 1950 to 1985 (13 members)

Trend in regional  $\phi_{ITCZ}$  vs inter-hemispheric (90 ° S to 90 ° N) shortwave cloud radiative effect between 1950 to 1985 (13 members)

Trend in regional  $\phi_{ITCZ}$  vs inter-hemispheric (90 ° S to 90 ° N) shortwave non-cloud radiative effect between 1940 to 1975 (13 members)

Trend in regional  $\phi_{ITCZ}$  vs inter-hemispheric (90 ° S to 90 ° N) shortwave cloud radiative effect between 1940 to 1975 (13 members)

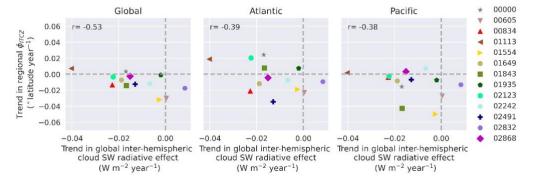

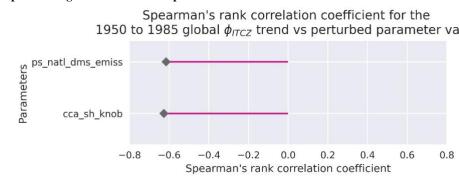

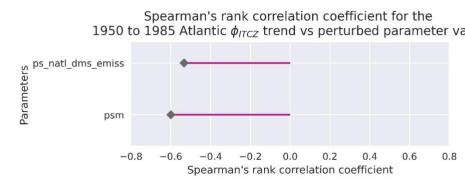

Figure S12: Plots of the parameters that have a Spearman's rank correlation coefficient or r > 0.5 with the trend in Syear rolling mean  $\Phi_{\text{TTCZ}}$  in 1950 to 1985 in global (top), Atlantic (middle) and Pacific (bottom) regional means. Individual ensemble members are coloured according to legend. Negative relationships are shown in pink and positive in green. Definitions of parameters are in Table S1.

Spearman's rank correlation coefficient for the 1950 to 1985 global  $\phi_{ITCZ}$  trend vs perturbed parameter values

Spearman's rank correlation coefficient for the 1950 to 1985 Atlantic  $\phi_{ITCZ}$  trend vs perturbed parameter values

Spearman's rank correlation coefficient for the 1950 to 1985 Pacific  $\phi_{ITCZ}$  trend vs perturbed parameter values

Figure S13. Time series of trend in 5-year rolling mean  $\Phi_{TTCZ}$  in 2006 to 2040 for RCP8.5, the internal variability is estimated from HadGEM3-GC3.1 (historical and SSP5-8.5) ensemble. This figure tests how the trend over a future time period of comparable size to the historical time period influences the range of trends in tropical precipitation across the ensemble.

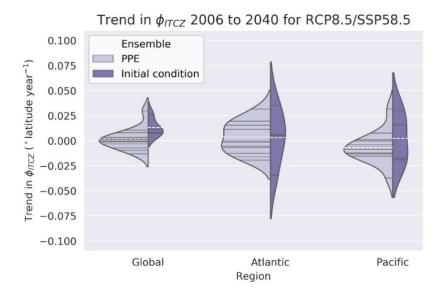

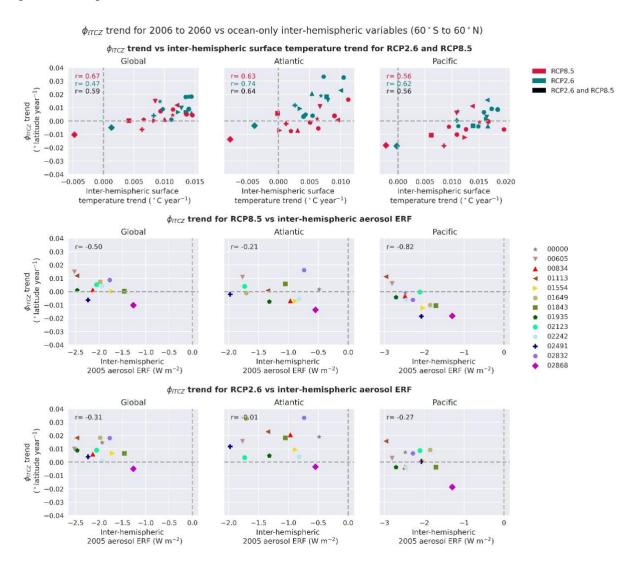

Figure S14: Scatter plot of trend in 5-year rolling mean  $\Phi_{TTCZ}$  in 2006 to 2060 (top) against ocean-only interhemispheric (60 °S to 60 °N) trend in surface air temperature (top), implied total forcing (middle) and 1860 to 1975 aerosol ERF (bottom) for global (left), Atlantic (middle) and Pacific (right) regional means. Individual ensemble members are coloured according to legend. The Spearman's rank correlation coefficient is shown at top left of each plot. For the top row, RCP8.5 is red, RCP2.6 is teal, and the scenarios combined is black.
