**Figure S1: Seasonal cycle of daily precipitation ( $\text{mm day}^{-1}$ ) along latitudinal bands. (a, g)  $90^{\circ}\text{S}$ - $45^{\circ}\text{S}$ , (b, h)  $45^{\circ}\text{S}$ - $15^{\circ}\text{S}$ , (c, i)  $15^{\circ}\text{S}$ - $15^{\circ}\text{N}$ , (d, j)  $15^{\circ}\text{N}$ - $40^{\circ}\text{N}$ , (e, k)  $40^{\circ}\text{N}$ - $65^{\circ}\text{N}$ , and (f, l)  $65^{\circ}\text{N}$ - $90^{\circ}\text{N}$ . Upper panels show daily mean precipitation in 5-year intervals and low panels show daily precipitation anomaly obtained by removing the annual mean from each year.**

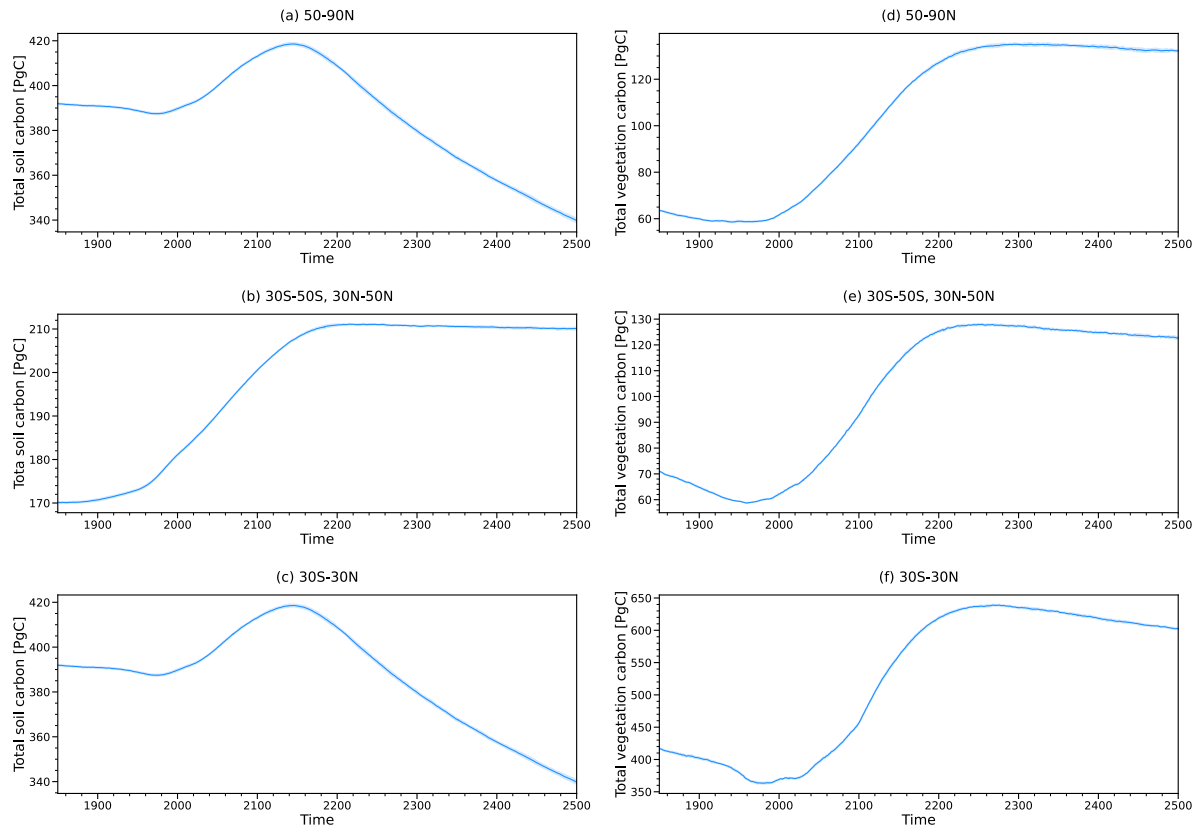

**Figure S2: Reference climatology of precipitation ( $\text{mm day}^{-1}$ ; upper panels) and 500 hPa vertical p-velocity ( $\text{Pa s}^{-1} \times 10^2$ ; lower panels). (a, d) Period spanning 1850-1949, (b, e) period spanning 2150-2249, and (c, f) period spanning 2401-2500.**

**Figure S3: Monthly precipitation (mm day<sup>-1</sup>) in (a) Tokyo (139.7°E, 35.7°N), (b) São Paulo (313.4°E, 23.6°S), (c) Mexico City (260.7°E, 19.4°N), (d) Mumbai (72.9°E, 19.1°N), (e) New York (286.0°E, 40.7°N), (f) Lagos (3.4°E, 6.5°N), and (g) Moscow (37.6°E, 55.8°N).**

**Figure S4: Time series of total soil carbon and total vegetation carbon. Total soil carbon (PgC) integrated over (a) 50°N-90°N, (b) 30°S-50°S and 30°N-50°N, and (c) 30°S-30°N. Total vegetation carbon (PgC) integrated over (d) 50°N-90°N, (e) 30°S-50°S and 30°N-50°N, and (f) 30°S-30°N.**

**Table S3** The centennial-timescale ensemble-mean export ratio ( $E_{F100/NPP}$ ), given as the ratio of export at 100 m ( $F_{100}$ ) to depth-integrated NPP. For each variable, averages are conducted over 10 years, and changes relative to the 1890s are given in parentheses.

Export Ratio [ $E_{F100/NPP}$ ] $F_{100}$ (PgC yr <sup>-1</sup> ) NPP (PgC yr <sup>-1</sup> )	Global integral	30°S-30°N integral	90°S-30°S integral	30°N-90°N integral
