Procedural remark by the Editor:

This article is based on a new integrated assessment model the structure of which is introduced in a precursory twin article ESDD-6-819-2015 / esd-2015-13 by the same authors. The reviewers of the precursory article raised questions on a quite fundamental level regarding structure and output of that model.

Hence for this very particular case of two twin articles I suggest to clarify the funda-

C508

mental aspects of the model structure, dealt with in article #1, first, before we would move on to some more detailed aspects of article #2. This procedure also suggests itself because a 2nd reviewer of article #2 has expressed that she or he were not willing to submit a review as long as issues of the 1st article could not convincingly clarified by the authors.

In summary, for now I will strive for clarification of the fundamental aspects of the critique expressed by the referees of the first article. In case of a positive outcome I will strive for an additional review of article #2.
