Thanks for a constructive review, containing many useful suggestions for improvement of the paper. If the editor approves submission of a revised paper we will take the reviewer comments into consideration. We may also use the data from the Zebiak-Cane model control run given in the Supplementary file of the reviewer, but have one question. The data used by L&V are averaged over 100 realisations. Is the data given in the file the result of one single control run, or is it averaged over an ensemble of realisations?
