Interactive comment on "A global assessment of gross and net land change dynamics for current conditions and future scenarios" *by* Richard Fuchs et al.

Anonymous Referee #1

Received and published: 12 February 2018

It's a good paper.

-Methodology But there is no detail of method. Authors write the outline of the methodology. Please add details (equations).

-Results Almost all results are not strange, but the grass loss in the arctic seems to be high. please add the explain.

-Discussion As mentioned in section 3, uncertainty is very serious. Misclassification leads gross land use change. this is the reason why land use moder don't use middle resolution remote sensing images. Please add much more discussion.
