

Dear Professor.

We added a fourth conclusion of article, as You suggested emphasizing the visitors impact for dune surface. Now this conclusion is as follows:

4. An investigation of geodynamic processes revealed the regularities and reasons of transformations of aeolian macro (hollows, etc.), meso- (rolls) and micro-(micro-terraces, etc.) forms. Changes in relief forms and their measurements confirm the "sensitivity" of aeolian sands of the Curonian Spit and the need of regulation of their protection. The abundance of visitors, their curiosity and activity make such regulation even more relevant. Such problematic places are as follows: Parnidis Dune, where visiting is unlimited, and Naglis Dune, where visiting is restricted and fee must be payed. In other drifting dune areas, visiting is completely banned.

With respect

Algimantas Česnulevičius
