Figures S1 – S4

### Introduction

This file contains supporting information for the paper Davies et al., entitled “**Back to the future II: tidal evolution of four supercontinent scenarios**”. Here we provide 20 million-year snapshots of the  $M_2$  global tidal amplitude for the four future supercontinent scenarios presented, each illustrating a different mode of supercontinent formation. See main text for details.

Figures S1a – n: Pangea Ultima is characterized by the closure of the Atlantic.

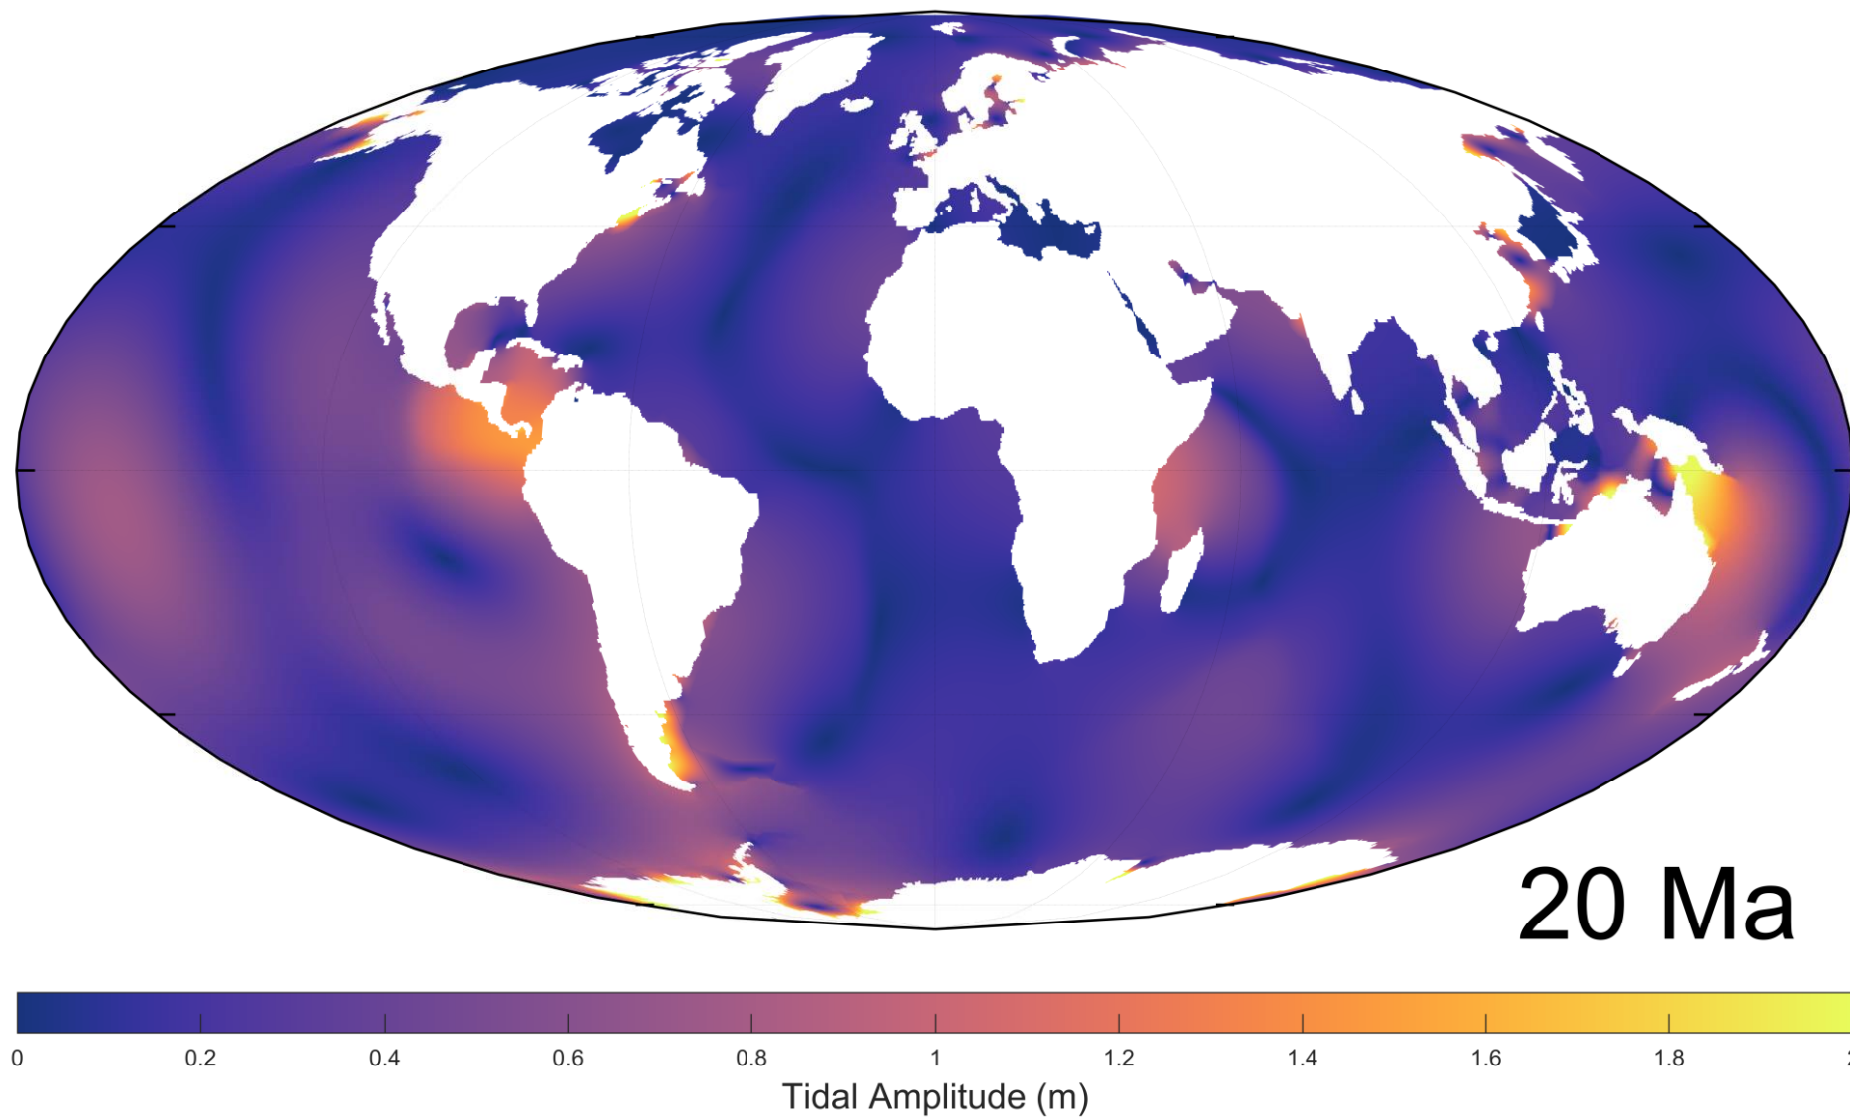

Figures S2a – k: Novopangea in contrast forms via the closure of the Pacific ocean.

Figures S3a – n: Aurica is formed by closure of both the Atlantic and the Pacific oceans.

Figures S4a – k: Amasia forms by the closure of the Arctic Ocean.
