This comment was to bring together panels from the main paper with similar panels for other cases from the supporting material. We went back and forth with this: Is it better to present everything together and risk overwhelming people with a large number of panels per figure (for one figure it would be 4 cases by 3 variables to give 12 panels) or better to do just one case in the main paper with the remaining cases in supporting material.

It is our judgment that presenting all of the information in the main paper would cause many readers' eyes to glaze over. Thus, we have decided to present a central case in the main paper and show other cases in the supporting material.

James Smoot also recommended some relabeling of figures. We now include a tables in the supporting material supporting each figure, with the numerical data plotted in the figure. This way if the reader wants to plot things a different way or look up a specific country, they can.

We appreciate his comments but ultimately did not take many of them on board.
