**Synthetic Data Parameterization**

| Sensor  | Time frame               | Relative Reliability |
|---------|--------------------------|----------------------|
| SSMI    | 1987-01-01 to 2002-04-01 | 0.7                  |
| TMI     | 1997-12-01 to 2015-04-01 | 0.5                  |
| WindSat | 2003-02-01 to 2012-07-01 | 0.44                 |
| AMSR-E  | 2002-06-01 to 2011-10-01 | 0.88                 |
| AMSR-2  | 2012-07-01 onwards       | 1                    |

15

**Table S1.** Time frame and relative reliability for the satellites making up the VODCA data

16

set. AMSR-2 is considered to be the most reliable (value of 1), with WindSat being the least

17

(value of 0.44). Values calculated roughly from the variability of the underlying data sets, and

18

to match aggregated synthetic patterns with those of the global VODCA patterns in lag-one

19

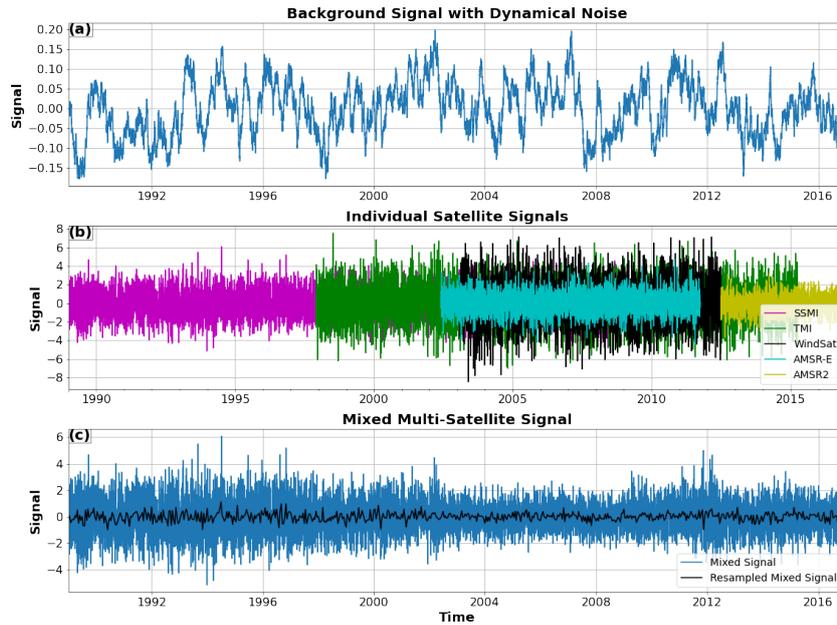

autocorrelation and variance.

| Sensor    | Time frame               | Relative Reliability |
|-----------|--------------------------|----------------------|
| NOAA 9F   | 1985-02-01 to 1988-09-01 | 0.87                 |
| NOAA 11H  | 1988-09-01 to 1994-09-30 | 1                    |
| NOAA 9F-d | 1994-09-01 to 1995-01-01 | 0.88                 |
| NOAA 14J  | 1995-01-01 to 2000-11-01 | 0.79                 |
| NOAA 16L  | 2000-11-01 to 2003-12-01 | 0.85                 |
| NOAA 17M  | 2003-12-01 to 2009-01-01 | 0.83                 |
| NOAA 18N  | 2005-08-01 onwards       | 0.7                  |
| NOAA 19N  | 2009-06-01 onwards       | 0.65                 |

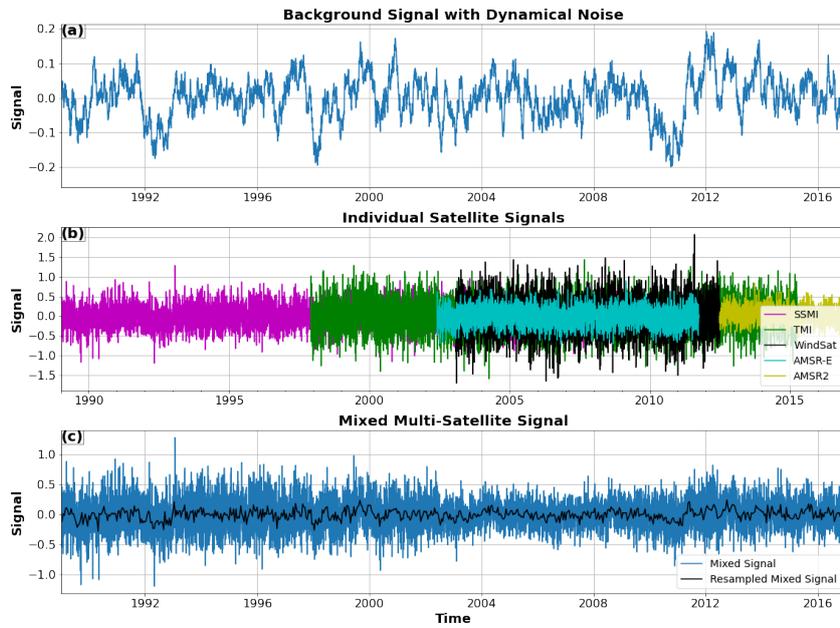

20 **Table S2.** Time frame and relative reliability for the satellites making up the AVHRR  
21 GIMMS3g data set. NOAA 11H is considered to be the most reliable (value of 1), with NOAA  
22 19N being the least (value of 0.65). Values calculated roughly to match the aggregated synthetic  
23 patterns with those of the global NDVI patterns in lag-one autocorrelation and variance, and are  
24 not drawn directly from computations of NDVI variance in GIMMS3g.

25

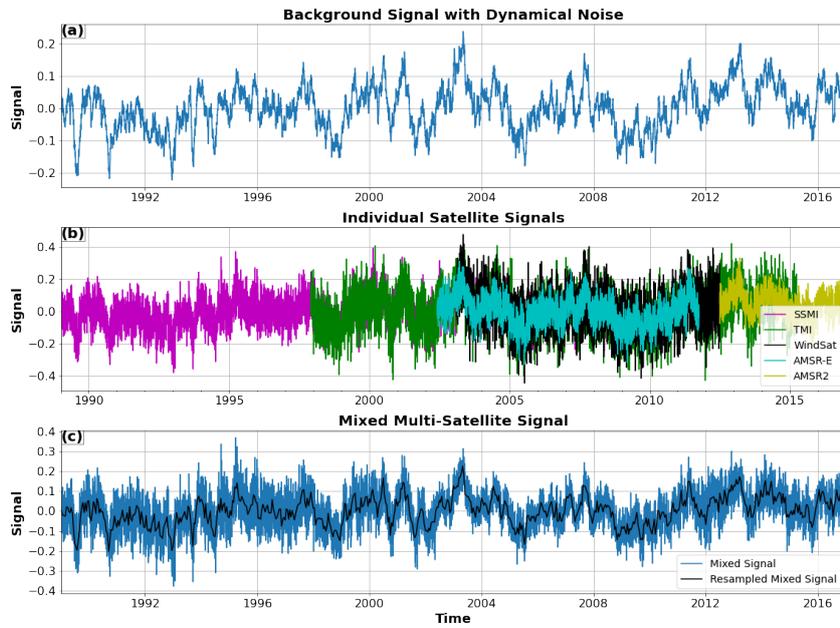

## Supplemental Figures

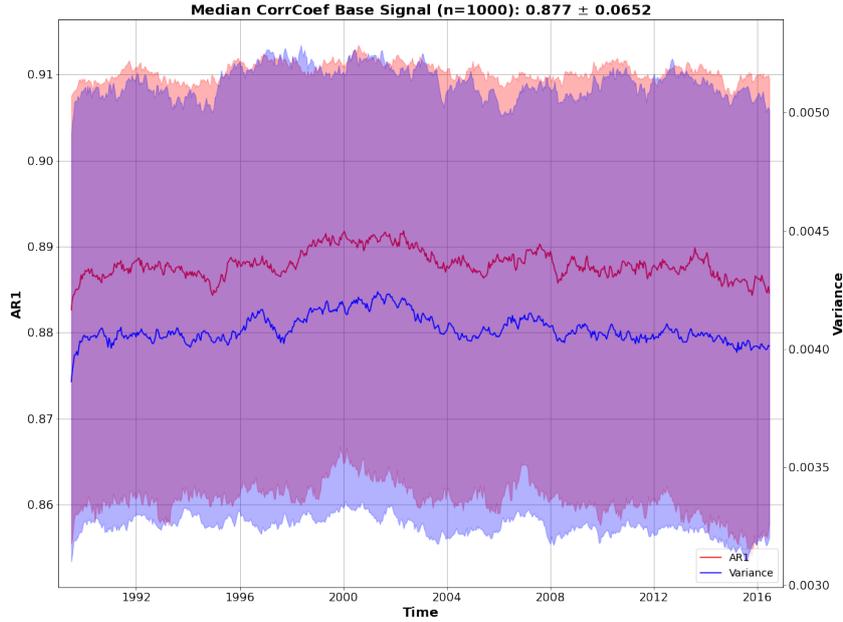

26 **Figure S1.** Synthetic Experiment for Vegetation Optical Depth (VOD), signal-to-noise ratio  
 27 set at 0.1. Relative measurement noise scaling ( $R_{satellite}$ , see Methods) set to values between 1  
 28 for the most reliable sensor and 0.44 for the least reliable. (a) Ornstein-Uhlenbeck process with  
 29 dynamical noise mimicking an underlying signal to be measured (see Methods). (b) Underlying  
 30 signal plus additional white Gaussian measurement noise by individual synthetic sensor scaled by  
 31 reliability  $R_{satellite}$ , based on the characteristics of the satellites used in the VOD data set (see  
 32 Supplemental Table S1 and Methods for details). (c) Combined synthetic signal via taking the  
 33 daily (blue) and bi-weekly (black) means.

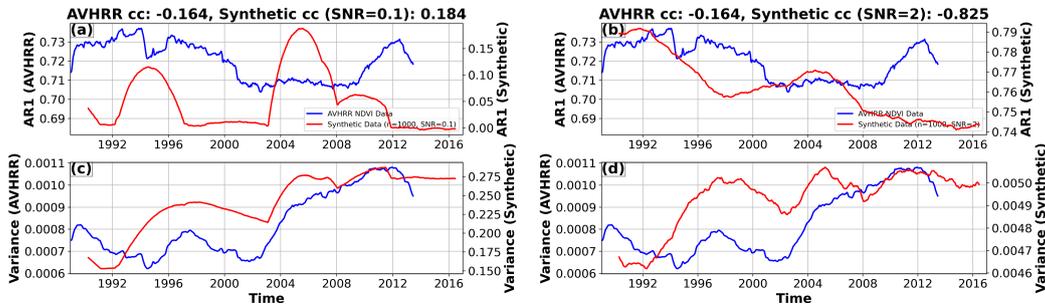

34 **Figure S2.** Synthetic Experiment for Vegetation Optical Depth (VOD), signal-to-noise ratio  
 35 set at 0.5. Relative measurement noise scaling ( $R_{satellite}$ , see Methods) set to values between 1  
 36 for the most reliable sensor and 0.44 for the least reliable. (a) Ornstein-Uhlenbeck process with  
 37 dynamical noise mimicking an underlying signal to be measured (see Methods). (b) Underlying  
 38 signal plus additional white Gaussian measurement noise by individual synthetic sensor scaled by  
 39 reliability  $R_{satellite}$ , based on the characteristics of the satellites used in the VOD data set (see  
 40 Supplemental Table S1 and Methods for details). (c) Combined synthetic signal via taking the  
 41 daily (blue) and bi-weekly (black) means.

42 **Figure S3.** Synthetic Experiment for Vegetation Optical Depth (VOD), signal-to-noise ratio  
 43 set at 2. Relative measurement noise scaling ( $R_{satellite}$ , see Methods) set to values between 1  
 44 for the most reliable sensor and 0.44 for the least reliable. (a) Ornstein-Uhlenbeck process with  
 45 dynamical noise mimicking an underlying signal to be measured (see Methods). (b) Underlying  
 46 signal plus additional white Gaussian measurement noise by individual synthetic sensor scaled by  
 47 reliability  $R_{satellite}$ , based on the characteristics of the satellites used in the VOD data set (see  
 48 Supplemental Table S1 and Methods for details). (c) Combined synthetic signal via taking the  
 49 daily (blue) and bi-weekly (black) means.

50 **Figure S4.** Median correlation coefficient between AR1 and variance (title,  $\pm$  one standard  
 51 deviation) for 1000 iterations of the underlying Ornstein-Uhlenbeck process without additional  
 52 measurement noise. AR1 and variance are highly co-correlated, as is to be expected when the  
 53 driving process and noise structure do not change through time or between synthetic samples.

54 **Figure S5.** Comparison between real and synthetic data. (a,b) AR1, and (c,d) variance for  
 55 synthetic data (red) and globally-averaged AVHRR GIMMS3g NDVI data (blue). Left column  
 56 shows low signal-to-noise ratio (SNR=0.1), right column shows SNR=2. AR1 and variance cal-  
 57 culated on a five-year rolling window. Correlation coefficients (cc) between AR1 and variance  
 58 plotted in titles. The data sets show both negative and positive correlations between AR1 and  
 59 variance depending on SNR. Note that satellite and synthetic data are not plotted on identical  
 60 y-scales.
